

# What remote will work with my Challenger garage door operator?

Saved From: <http://www.linearcorp.com/faq/article.php?id=525>

---

For the built in receiver for the Wayne-Dalton Wizard WD2113/2115 operators, there are 2 possible radio systems. If the color of the control board that the code setting switches (in the lower left corner of the back of the motor unit) are mounted on is green, you can use any of the Multi-Code 300 MHz transmitters with the unit. If the board is tan, you will need the Martec transmitters (not manufactured by Linear).

For the built in receiver for the 9300M/9500M series operators, you will need the MVP transmitter in 318 MHz part number 190-110925.

All other Challenger operators including the CH1000 series, the 9100/9300/9500 series, and the AC9300/AC9500 series used an external receiver. You will need to know the model number and frequency of the external receiver to determine the correct remote for your unit. This information should be available on the bottom of the receiver itself, typically mounted with three screws on the back of the operator in your garage.

All of the Challenger operators including the WD2113/2115 series and the 9300M/9500M operators have provisions for installation of an external receiver, so you should confirm whether you are using the built in receiver or an external receiver before you order remotes for these units.
